Currently in the first term of diploma. Working on my own startup. Left job to continue this degree.

Description

We have web app name quizmaster in which any student after registration can attempt any quiz of their interest can also see their performance summary.

Technologies used

Flask- For backend logic

Flask-SQLALCHEMY – For Database models

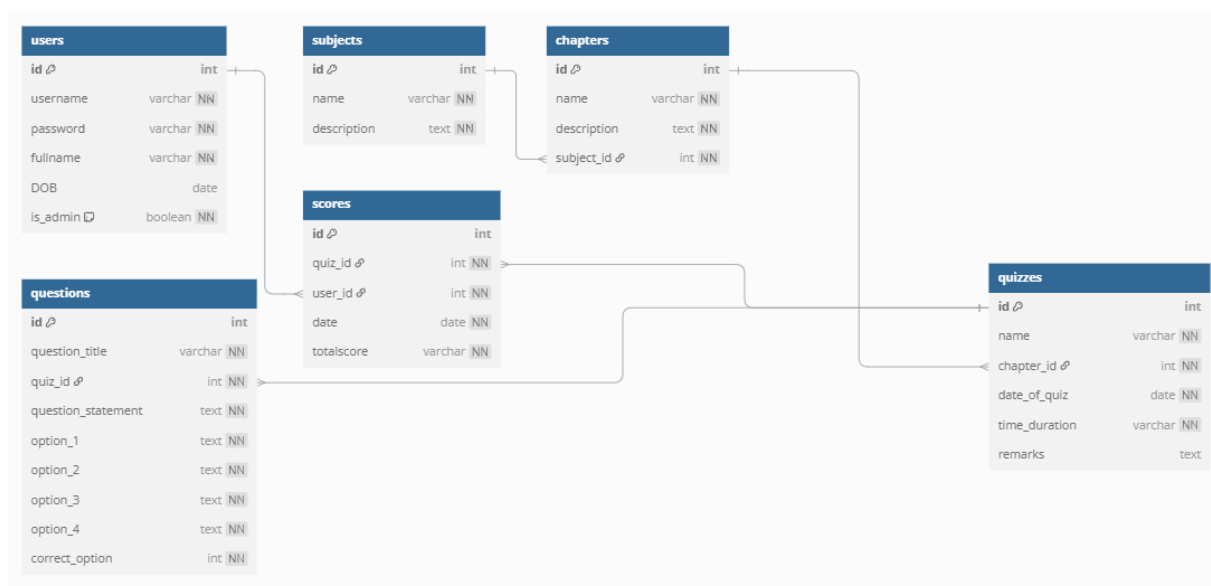

Jinja – Jinja templating for frontend rendering of data

HTML – Frontend pages structure

CSS – Design of pages

Bootstrap – readymade designs of forms

DB Schema Design

As we can see that relationships and constraints between tables are clearly visible making it intuitive

API Design

I have created Api endpoints for subjects like GET /api/view_subjects, POST /api/add_subjects/<int:id> , PUT /api/put_subjects/<int:id> ,DELETE /api/deletesubject/<int:id>

Architecture and Features

In my project Folder I have app.py, README.md, requirment.txt files and folders such as application folder, templates folder and static folder. Inside application folder I have controllers.py, api_controllers.py, models.py and database.py files. Inside templates I have all the html files. Inside static folder I have images and style file.

In Quiz master application core features like admin control CRUD operations on Subjects, chapters, quizzes, questions. These features are implemented using creating separate routes with flask for each of the category and using jinja templating in html with little help of css and bootstrap and storing their into database and creating models with flask-sqlalchemy for how to store data in database. Summary and search functionality is also available for admin and user which is developed with remembering but special keywords in mind.

Additional feature recommended for implementation is api develop with help of flask-restful Api endpoints are developed for subjects CRUD operations and to show quizzes with jsonify.
